Confidential - AI Infrastructure Capital Expenditure Update

May 2026 | Internal Planning - UK

Approved Additional CapEx: GBP 47 Million (H2 2026)

The Board approved incremental capital expenditure of GBP 47M to accelerate deployment of a new AI training and inference cluster in the Manchester region (UK). This follows the successful pilot of 128 H100 GPUs in Q1.

Cluster Specifications (Manchester Region)

- 512 NVIDIA H100 80GB SXM GPUs (8x DGX H100 systems)
- Interconnect: 3.2 Tbps InfiniBand fabric
- Storage: 4.8 PB high-performance parallel filesystem
- Target PUE: 1.18 (liquid cooling primary loop)
- Commissioning target: September 2026
- Power via National Grid with dedicated renewable PPA

Capacity & ROI Projections (UK)

Expected to support ~240,000 concurrent inference sessions by Q4 2026 (base case).

Internal model: Project IRR 34%, payback 22 months at 78% average utilisation after ramp. UK data residency and lower latency for European enterprise customers are key strategic benefits.

Key Risks (UK Context)

- Power delivery and grid connection timelines (Ofgem / National Grid coordination)
- GPU lead times (14-18 weeks; buffer of 64 units secured)
- Potential changes to UK AI compute incentives or planning permissions

Limited distribution: Finance, Infrastructure, Exec. Destroy per data classification policy. Nexara Daniel Ltd (UK).
